Photo Rick Rizner, Chris MannersA 3.5-inch LCD color dominates the top of the \$199 Canon Pixma iP6600D. The display - the largest we've seen on an inkjet printer - flips up, making it easy to view images and navigate the menu, including options for touching photos. The door on the front of the printer hides two media card slots that are able to read the most common card formats (Compact Flash, Memory Stick, Memory Stick Pro, Microdrive, MultiMedia Card, SD Card and SmartMedia). But you'll need an additional adapter to use other formats (Memory Stick Duo, Memory Stick Pro Duo, miniSD Card and xD-Picture Card). Transferring images from media cards to your computer is relatively quick, thanks to the USB 2.0 connection between the printer and the computer. The direct-print port allows you to print directly from a pictBridge-compatible digital camera via a USB cable. Unlike competing models from Epson and HP, however, the iP6600D cannot print images with USB flash drives connected to its direct port printing. However, it has a built-in IrDA interface that allows you to print with camera phones and PDAs with infrared transmitters, and an additional Bluetooth adapter is available for \$80. iP6600D can hold sheets of different sizes, and many of them. The box at the base of the printer takes up to 150 sheets of paper the size of a letter sticking out of the front to do so. When carrying 4-by-6-inch or 5-by-7-inch paper, the drawer remains flush from the front. The vertical sheet feeder at the back of the printer can hold an additional 150 sheets, and can hold up to the legal size of the paper. the iP6600D comes with a built-in duplexer for making double-sided prints, and before printing on the second side it waits a few seconds so the ink on the first side can dry out. Each of the printer's six ink cartridges has a red LED that flashes slowly when the ink runs out and then faster as the cartridge approaches empty. This handy feature makes it obvious which cartridge needs to be changed. On the photo am iP6600D made very high-quality prints. The photos looked bold, with plenty of contrast and small details, although the skin tones looked more bronze than we would have liked. Grayscale images looked very attractive overall, although they were a small magenta cast and highlights lacking some detail. Unlike the Canon Pixma iP5200R, which we also tested this month, the iP6600D has no pigmented black ink. Consequently, the text prints with iP5200R looked better. the iP6600D printed several large characters with small patches of white paper showing through, and some blotting in the paper made the edges look fuzzy. iP6600D printed different lines at small sizes in our art printing line, although horizontal ripples in vertical lines and the texture on the horizontal lines somewhat overshadowed the seal. The color graphics printed on ordinary paper were absent in dark areas, and the skin tones seemed unnatural; The facial details looked sharp, however. Just a few months ago, we would have extolled the exalted iP6600D print speed, but the iP6600D seems a bit poky compared to a few other new models. iP6600D printed text at 3.2 pages per minute, and graphics at 1.5 ppm; his brother, Canon iP5200R, printed text at a gap of 8.7 ppm and graphics at 2.9 ppm. it took 45 seconds for iP6600D to print a 5-by-7-inch photo, but HP Photosmart 8250 printed the same photo in just 29 seconds. iP6600D is particularly good at printing photos directly from a digital camera or media card, and two paper trays and a duplexer add to its versatility. The large LCD color and two-way printing make the well-designed iP6600D attractive. He quickly prints high-quality photos. The large color LCD display Very high quality photo prints by William Pullman Updated September 28, 2017 Canon Pixma printers support several types of paper, including photo paper. Photo-paper is used to print digital images because the quality of paper is higher than standard printed paper. Because photo-piece paper has a certain side of printing, you have to insert it into the printer correctly to ensure the correct printout. Download the photo paper in Canon Pixma correctly for high-quality prints. Feed the TrayTurn on the printer and press the paper feeder switch until the Auto Sheet Feeder light is on. Climb the paper sheet feeder at the top and back of the printer and slip out of the paper support. Take a stack of no more than 10 pieces of photo paper and smooth out the corners if they are curled. Twisted corners can cause plugs in the printer. Place the paper in the paper feeder with the paper side printed up. The printed side of the photo paper is the shiny or whiter side of the paper. Print documents as needed. The CassetteSwitch paper is on the printer and press the paper feed switch until the cassette light is turned on. Pull on the cassette at the bottom of the printer to slip out of the printer. Flatten the corners of the stack with no more than 10 sheets of photo paper if the corners are twisted. The paper can get stuck in the printer if the corners are curled. Place a stack of paper in the cassette so that the paper touches the right side and the printed side of the paper is turned downwards. Adjust the plastic paper guides to touch the paper. A guide to the paper stack helps make it easier to move the paper into the printer. Slide the cassette back to the bottom of the printer. The printer is ready to print. Artwork: Rick Rizner, Chris MannersThe Canon Pixma MP950 is the ultimate printer/scanner combo for serious photo lovers - and its price is seriously high-end as well. Gorgeous 3.6-inch color LCD screen flips over from the front to reveal a neat control panel. Two multimedia slots outside the front of the device take most digital memory cards though You need to buy an adapter to read xD-Picture Cards.Previews look great on the screen and you can easily perform various editing and enhancement tasks without using a computer. And when you transfer images to your computer, it happens quickly through the MP950 in the Hi-Speed USB 2.0 port. The backlight built into the lid works with the film holder so you can scan up to 12 negatives or 8 slides at a time. You can view images one at a time on the screen, perform improvements, and choose which ones to print (just as you can with images to read from a media card). When not in use, the film holder is neatly stacked behind the mat to support the documents. The MP950 has an infrared port that can receive photos sent from a mobile phone via infrared. This feature can become more useful as camera phones reach resolutions that are actually good at typing. Of course, you'll also get the ubiquitous direct print port with PictBridge-ready digital cameras. The port also accepts an additional \$80 Bluetooth adapter for printing with appropriately equipped phones and PDAs, but unlike many photo printers, you can't print from images stored on a USB flash drive. While the MP950 omits office functions such as a built-in fax machine and automatic document feeder, it has excellent paper capacity. Double paper trays allow you to store the most commonly used paper in a drawer at the base of the device, while the types of paper you change most often, such as the different sizes of the paper photo, are folded into a vertical feeder sheet at the back. The integrated duplex prints on both sides of the paper, stopping briefly for the first side to dry before printing on the reverse. Canon even sells two-way photo paper, which makes for good album pages. Red LEDs attached to individual ink cartridges slowly blink when the ink levels are low, and the flashes are faster as they near empty. You get at least seven different ink, including dye and black pigment. Our team rated the text and graphics printed on plain paper among the best they saw from the inkjet printer. Thanks in part to the pigmented black text, there were clear, dark symbols. The color photo showed small details and a nice contrast, with a slight posterization (lack of a smooth gradient) where dark areas switched to solid black. Our intricate pattern of line art was a puzzle because we saw areas of wide, wavy horizontal stripes about an inch apart, and some weak diagonal jamming patterns in blocks of closely located lines. The photos printed on glossy paper were excellent, with bright, bold colours - although we felt they were perhaps a touch too dark overall. By putting the scanner through its paces, we into trouble. Its resolution of 3200 by 6400 points per inch is one of the highest available. However, the huge amount of data in maximum resolution was too much for the driver and we were unable to capture several of our test images. With Canon's permission, we have reduced the resolution to 2800 by 2800 dpi for our where we got good results for photos, but not for text documents. Having operated the MP950 as a photocopier, we saw very good reproductions of both text and photos. Although the quality of mp950 printed text documents declined, it printed them at an astounding 8.4 pages per minute, while a simple graphics paper appeared at 2.4 ppm. Our sample of the photo is printed on a glossy paper the size of a letter in just 47 seconds. The scan was also highly competitive, with our 4-by-5-inch photo scanning in just 8 seconds (not including a preview). Copying was the fastest we've seen from the inkjet multifunctional deviceit output of our test image in 14 seconds. The Canon Pixma MP950 combines high-quality printing with a variety of ways to capture images. He performs all the tasks quickly, but the quality of his scanning can be more consistent.
